## SUMMARY

This report is Volume V of a series which list radiation exposures of underground nuclear testing participants affiliated with the U.S. Department of Defense (DoD), including military, DoD-civilian, and DoD-contractor personnel. This book covers the calendar year 1986. Participants are listed alphabetically and their total beta and gamma exposures for the year are shown. Exposures were determined from processed personnel film badge dosimeters.

Average and maximum total gamma exposures for individuals are listed below:

<u>Year</u>	<u>Average mR</u>	<u>Maximum mR</u>
1986	0.63	875

## PREFACE

The United States Government conducted 194 nuclear device tests from 1945 through 1958 during atmospheric test series conducted at sites in the United States and in the Atlantic and Pacific oceans. The U.S. Army's Manhattan Engineer District (MED) implemented the testing program in 1945, the Joint Chiefs of Staff conducted Operation CROSSROADS in the Pacific during 1946, and the Atomic Energy Commission (AEC), successor to the MED, administered the program from 1947 until testing was suspended by the United States on 1 November 1958.

Of the 194 nuclear device tests conducted, 161 were for weapons-related or weapons-effects purposes, and 33 were safety experiments. An additional 24 nuclear experiments were conducted from December 1954 to February 1956 in Nevada. These experiments were physics studies using small quantities of fissionable material and conventional explosives.

President Eisenhower had proposed that test ban negotiations begin on 31 October 1958, and had pledged a one year moratorium on United States testing to commence after the negotiations began. The Conference on Discontinuance of Nuclear Weapons Tests began in Geneva on 31 October 1958, the U.S. moratorium began on 1 November, and the AEC detected the final Soviet nuclear test of their fall series on 3 November 1958. Negotiations continued until May 1960 without final agreement. No nuclear tests were conducted by either nation until 1 September 1961 when the Soviet Union resumed nuclear testing in the atmosphere. The United States began a series of underground nuclear tests in Nevada on 15 September 1961, and U.S. atmospheric tests were resumed on 25 April 1962 in the Pacific.

The United States conducted four atmospheric tests in Nevada during July 1962, and the last U.S. atmospheric nuclear test was conducted in the Pacific on 4 November 1962. The Limited Test Ban Treaty, which prohibited tests in the atmosphere, in outer space, and underwater, was signed in Moscow on 5 August 1963. From resumption of United States atmospheric testing on 25 April 1962 until the last atmospheric test on 4 November 1962, 40 weapons-related and weapons-effects tests were conducted as part of the Pacific and Nevada atmospheric test operations. The underground tests, resumed on 15 September 1961, have continued on a year-round basis through the present time.

In 1977, 15 years after atmospheric testing stopped, the Center for Disease Control (CDC)<sup>1</sup> noted a possible leukemia cluster within the group of soldiers who were present at the Nevada Test Site (NTS) during the SMOKY test event, one of the Nevada tests in the 1957 PLUMBBOB series. After the CDC report, the Veterans Administration (VA) received a number of claims for medical benefits filed by former military personnel who believed their health may have been affected by their participation in the nuclear weapons testing program.

In late 1977, the DoD began a study to provide data for both the CDC and the VA on radiation exposures of DoD military and civilian participants in atmospheric nuclear testing. That study has progressed to the point where a number of reports describing DoD participation in atmospheric tests have been published by the Defense Nuclear Agency (DNA) as the Executive Agent for the DoD Nuclear Test Personnel Review (NTPR) program.

On 20 June 1979, the United States Senate Committee on Veterans' Affairs began hearings entitled Veterans' Claims for Disabilities from Nuclear Weapons Testing. In addition to requesting and receiving information on DoD personnel participation and radiation exposures during atmospheric testing, the Chairman of the Senate Committee expressed concern regarding exposures of DoD participants in DoD-sponsored and Department of Energy (DOE)<sup>2</sup> underground nuclear test events.

The Chairman requested and received information from the Director, DNA, in an exchange of letters through 15 October 1979 regarding research on underground testing radiation exposures. In early 1980, DNA initiated a program to acquire and consolidate underground testing exposure data in a set of published reports similar to the program then underway on atmospheric testing data. This book is the fifth in a series listing radiation exposures of

---

<sup>1</sup> The Center for Disease Control was part of the U.S. Department of Health, Education, and Welfare (now the U.S. Department of Health and Human Services). It was renamed The Centers for Disease Control on 1 October 1980.

<sup>2</sup> The U.S. Department of Energy succeeded the U.S. Energy Research and Development Administration (ERDA) in October 1977. ERDA had succeeded the U.S. Atomic Energy Commission on 19 January 1975.

DoD military, civilian, and contractor participants in underground nuclear test events.

#### SERIES OF REPORTS.

Most reports in this series discuss DoD-sponsored underground test events, in chronological order, after presenting introductory and general information. The reports cover all underground test events, identified as DoD-sponsored in ANNOUNCED UNITED STATES NUCLEAR TESTS (NVO-209) published each year by the DOE Nevada Operations Office, Office of Public Affairs, except one category. The category of events not covered were nuclear test detection experiments in a program named VELA-UNIFORM. Generally, reentries after these tests were not performed, so significant exposure of participants to radiation did not occur.

One report will discuss general participation of DoD personnel in DOE underground nuclear test events, with specific information on those events which released radioactive effluent to the atmosphere and where exposures of DoD personnel were involved.

This series of volumes will constitute a census of DoD personnel and their radiation exposure data. This fifth volume of the Census Report lists radiation exposures of DoD-affiliated personnel (military, civilian, and contractor) who participated in U.S. underground nuclear tests during the 1986 calendar year. Distribution of all volumes of the Census Report is necessarily limited by provisions of the Privacy Act.

#### METHODS AND SOURCES USED TO PREPARE THE VOLUMES.

Information for these reports was obtained from several locations. Classified documents were researched at Headquarters, DNA, Washington, D.C. Additional documents were researched at Field Command/DNA, the Air Force Weapons Laboratory, and Sandia National Laboratories, Albuquerque, New Mexico. Most of the radiation measurement data were obtained at DOE, Nevada Operations Office (DOE/NV), and its support contractor, Reynolds Electrical & Engineering Company, Inc. (REECo), both in Las Vegas, Nevada.

Unclassified records were used to document underground testing activities when possible, but, when necessary, unclassified information was extracted from classified documents. Both

classified and unclassified documents are cited in the List of References at the end of each report. Locations of the referenced documents also are shown. Copies of most of the unclassified references have been entered in the records of the Coordination and Information Center (CIC), a DOE facility, in Las Vegas, Nevada.

Radiation measurement and exposure data, event data, and offsite reports generally are maintained in hard copy or on microfilm at the REECo facilities adjacent to the CIC or as original documents at the Federal Archives and Records Center, Laguna Niguel, California. The Master File of all available personnel exposure data for nuclear testing programs on the continent and in the Pacific from 1945 to the present is maintained by REECo for DoD and DOE. Data for this volume of the Census Report were obtained from the DoD/DOE Master File.

#### ORGANIZATION OF THIS VOLUME.

A summary of this volume appears before this Preface. It includes the period covered by this volume, average individual total gamma exposure for each year, and maximum individual total gamma exposures for each year.

An introduction following this Preface discusses gamma and internal exposures (if any) and methods used to determine these exposures. Information also is given on film badge and records systems.

Section 2 of this volume lists participants alphabetically. Total exposures per individual per year are shown; where possible, an organization and identification number for each individual is listed.

After the Personnel Dose Information Section are the appendices containing organization codes, abbreviations and acronyms, and glossary of terms.

## SECTION 1

### INTRODUCTION

The first United States nuclear detonation designed to be fully contained underground was the RAINIER tunnel event conducted by the University of California Radiation Laboratory (UCRL) for the AEC in Nevada 19 September 1957. This was a weapons-related experiment with a relatively low yield of 1.7 kilotons (kt). The second tunnel event with a significant nuclear yield was a safety experiment on 22 February 1958, also conducted in Nevada by UCRL for the AEC. This experiment, the VENUS event, resulted in a yield of less than one ton. These two tunnel events and five additional underground safety experiments with zero or only slight yields were the beginning of the United States underground nuclear testing programs, currently the only type of nuclear detonation testing permitted by treaty. The first DoD-sponsored underground nuclear weapons-effects test was the 5.7 kt HARD HAT event conducted by the Defense Atomic Support Agency (DASA) on 15 February 1962 in Nevada.

#### 1.1 HISTORICAL BACKGROUND.

While technical conferences between the United States and the Soviet Union on banning nuclear detonation tests continued, and concern regarding further increases in worldwide fallout mounted, a number of nuclear tests were conducted underground during 1958 in Nevada. Prior to the United States testing moratorium, six safety experiments in shafts, five safety experiments in tunnels, and four weapons-related tests in tunnels were conducted by user laboratories. Radioactive products from several of these tests were not completely contained underground. Containment of nuclear detonations was a new engineering challenge. Understanding and solving the majority of containment problems would require years of underground testing experience.

When the United States resumed testing on 15 September 1961, the first 32 tests were underground, including a cratering experiment with the device emplaced 110 feet below the surface. The DOMINIC I test series in the Pacific and the DOMINIC II test series in Nevada (also named SUNBEAM by DoD) during 1962 were the last atmospheric nuclear detonation tests by the United States.

The commitment by the United States to reduce levels of worldwide fallout by refraining from conducting nuclear tests in the atmosphere, in outer space, and underwater was finalized when the Limited Test Ban Treaty with the Soviet Union was signed on 5 August 1963. On 31 March 1976, the United States and the Soviet Union further agreed to limit the maximum yield of underground tests to 150 kt. Currently, yields are reported as being within a particular range; less than 20 kt, 20 to 150 kt, or less than 150 kt.

## 1.2 UNDERGROUND TESTING OBJECTIVES.

The majority of United States underground tests have been for weapons-related purposes. New designs were tested to improve efficiency and deliverability characteristics of nuclear explosive devices before they entered the military stockpile as components of nuclear weapons.

In addition to weapons-related tests, safety experiments with nuclear devices also were conducted by user laboratories. These experiments were used to evaluate potential nuclear yield or safety systems by detonating conventional high explosives in a manner which might occur in a nuclear accident during transportation, handling, or storage of weapons.

Weapons-effects tests sponsored by the DoD were conducted to determine vulnerability or survivability of military systems or components when exposed to one or more effects of a nuclear detonation. The nuclear devices for these tests were provided by DOE weapons development laboratories and were designed to be similar to the actual nuclear components used in nuclear weapons. Actual weapons configurations only were used in a few test events. Military systems, structures, materials, electronic experiments, and other related experiments were provided by DoD and DOE agencies. Many of these tests were very complex and involved greater numbers of participants than other categories of tests previously mentioned. Personnel from DNA, other government organizations, user laboratories and contractors, and DoD contractor agencies were involved.

Some tests were designed to study the response of hardened structures or geologic formations to shock waves generated by nuclear detonations. Many tests were designed to study the

response of military components to effects of radiation produced by nuclear weapons. Such tests required a direct line of sight between the nuclear device and the experiments. Many of the radiation-effects tests required the simulation of high altitude (up to exoatmospheric) conditions. These tests involved installation of experiments inside large steel line-of-sight (LOS) pipes, hundreds of feet in length, with maximum diameters of several feet. Large vacuum pumps were utilized to reduce pressure inside the pipes to the desired simulation level.

### 1.3 TEST PARTICIPANTS IN THIS VOLUME.

DoD-affiliated personnel listed in this volume participated during the testing period for 1986. There were 13 underground tests during this period, of which one was sponsored by DoD and the remainder conducted by DOE. Many participants in DoD tests were not DoD-affiliated personnel and are not listed in this volume. On the other hand, some DoD-affiliated personnel participated in DOE tests, and their exposures at those tests are included in this volume.

Activities of DoD-affiliated participants at DoD-sponsored tests covered a broad spectrum, from directing the tests, through measurements and experimenting, to support functions. DoD-affiliated participants in DOE tests usually were limited to support aircraft personnel, military personnel in the DOE Test Controller's organization, and DoD military and contractor personnel conducting experiments similar to those conducted during DoD-sponsored test events.

### 1.4 DETERMINATION OF EXPOSURE DATA.

The primary radiation exposures monitored and recorded for test participants are from gamma and x radiation. X rays are the same type of electromagnetic radiations as radio and television signals or light, except that x radiation is of much higher energy. X rays result when high-speed negative electrons release energy as they are slowed down near the positively charged nuclei of atoms, or when electrons orbiting the nucleus release energy as they drop into lower energy orbits. Gamma radiation and x radiation of the same energy are identical except for their origins. Gamma radiation originates in the nuclei of atoms when certain nuclear reactions take place.

Both gamma and x radiation affect film in film badge dosimeters like light affects unexposed film. Films are wrapped in light-tight packets the same size as dental x-ray packets. Packets have areas covered by one or more metal filters to make the film emulsions respond more evenly to different energy gamma or x radiations. When the film from a film packet exposed to gamma or x radiation is developed, the film exhibits a darkening or increased optical density which can be related to the degree of gamma and x-radiation exposure. Other factors, however, can result in darkening of the film emulsion. Light leaks in the packet, pressure damage, excessive heat, high humidity, and aging are some of these factors. Almost all damage and environmental effects on film packets cause increased darkening of the developed film emulsion and subsequent overestimates of radiation dose received by the wearer.

Film badges may detect radiation from some luminous dial watches, clocks, and compasses; from uranium-colored pottery and dishes; or television sets if the badges are left near or on these objects for a few days. On the other hand, film badges do not detect very low doses such as those all people receive from natural radioactivity in earth materials and of cosmic origin.

The film badge dosimeter used from 1962 through 1965 at the Nevada Test Site (NTS) was a Du Pont packet with a lead filter wrapped around the packet covering an area one half by one inch on each side. The packet contained two films, a low range and a high range component, and was used to determine gamma and x-radiation exposures only. The film packet was worn in a small plastic bag attached to the security badge.

A combination personnel dosimeter and security credential holder was put in use at NTS in 1966. This Du Pont two-component packet, which had the capability to determine beta, gamma, and x radiation exposures, was used in this dosimeter until March 1971, when Du Pont no longer manufactured the packet. Subsequently, a Kodak Type III packet was used. This film packet contained two component films, one low range and one high range. Gamma exposure ranges of the two components were 30 mR to 10 R and 10 R to 800 R, respectively.

Other dosimeter types have been used to monitor neutron exposure and exposure to extremities from ionizing radiation. Few of these exposures are recorded for DoD-affiliated participants and

such exposures are not included in the Census Report. However, in 1979, the Albedo neutron dosimeter, a thermoluminescent dosimeter (TLD) component system, was adopted for use at the NTS because of its increased sensitivity to a wide neutron energy range. This TLD, not part of the standard dosimeter packet, was only issued to those personnel who had a potential for exposure to a neutron source. Figure 1-1 shows the NTS combination personnel dosimeter, including the Albedo TLD, and the security credential holder. This system was used from 1979 through 1986.

There are no DoD-participant records in this report that reflect any doses from internal deposition of radionuclides as determined by analysis of body fluids, direct measurement of radiation from particular body organs, and direct measurement of the whole body with special radiation detection equipment. Previously, only one whole-body dose from internal deposition of tritium was recorded for 1964; only one tritium dose was recorded for 1968; and only two thyroid doses from radioiodines were recorded for 1968.

#### 1.5 EXPOSURE RECORDS.

This information represents the latest and most accurate exposure data available; however, it is continually being updated and some changes may be expected in the future. To obtain the latest information available before revised copies of this report are published, please consult the Master File of exposure records. A Master File of exposure records for all nuclear weapons and nuclear device testing from 1945 to the present on the continent and in the Pacific is maintained for DoD and DOE at REEC's Las Vegas facilities. Also maintained at that location are archival source documents which support data in the Master File. Any nuclear test participant may request and obtain a copy of his or her radiation exposure history from the following address:

Radiological Evaluation Section  
Reynolds Electrical & Engineering Co., Inc.  
Post Office Box 98521 M/S 543  
Las Vegas, NV 89193-8521

For comparison purposes, the annual occupational whole-body penetrating radiation exposure guide used at NTS during the exposure periods in these volumes was 5,000 mrem, and the quarterly guide was 3,000 mrem. Falling in this category are doses from gamma and x radiations and from tritium, which is a weak beta radiation emitter, but which diffuses throughout the

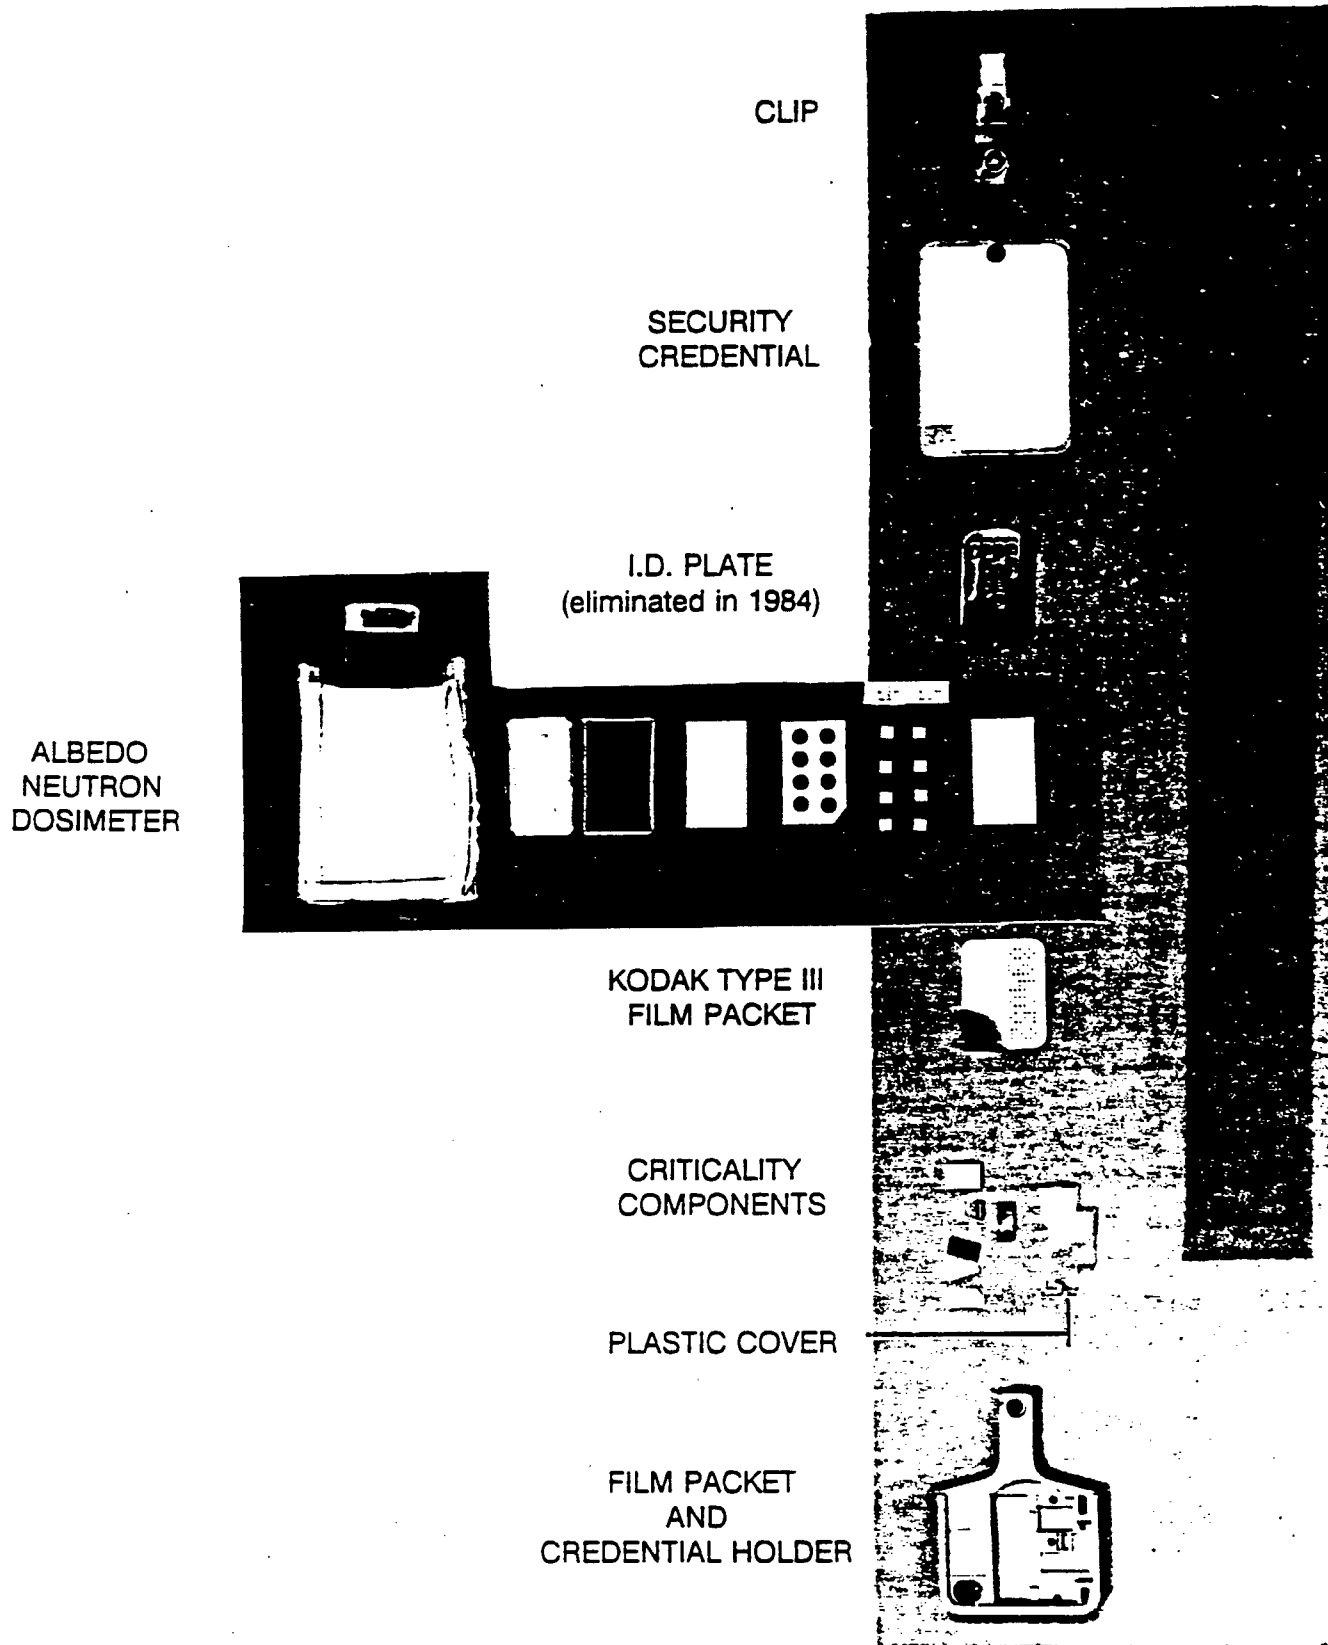

Figure 1-1. Combination Personnel Dosimeter and Security Credential Holder.

body water. The standard for dose to the thyroid was 30,000 mrem per year and 10,000 mrem per quarter in the early underground testing years, until it was changed in 1978 to the current 15,000 mrem per year and 5,000 mrem per quarter. The same standards and changes applied to dose to unlimited areas of the skin.

Identification numbers listed in these Census Report volumes from 1962 through 1970 are a combination of: (1) military serial numbers, (2) social security numbers, and (3) NTS numbers. Starting in 1971 and continuing to the present, only social security numbers are listed. For individuals not having a social security number, an identification number (i.e., A00-00-XXX) was assigned. Serial numbers would have been preferred in all cases, but were not available in most NTS records. The "NTS" number was an identification number assigned by NTS security force badge office personnel when a permanent security badge was issued. It was later used by REECo as an employee number.

The organization codes listed have been standard at NTS since 1961. An organization code designation of "V" indicates that an individual was a visitor at the NTS representing more than one organization within a given year. The organization names, however, have changed in some instances. Organization codes and accompanying names may be found in Appendix A to each Census Report volume. The current organization name is listed, and any previous organization names for the particular code are listed in parenthesis. Listed in Appendix B are abbreviations and acronyms used in the text. Appendix C is a glossary of terms used in the text.

- 0998 Other DOE/NV Contractors

## APPENDIX B

### ABBREVIATIONS AND ACRONYMS

The abbreviations and acronyms in the following list are used in this, the fifth volume of the Underground Nuclear Test Personnel Review (UNTPR) Census Report. Additional information may be found in the text and in the Glossary of Terms.

AEC	Atomic Energy Commission
CDC	Centers for Disease Control (formerly the Center for Disease Control)
CIC	Coordination and Information Center
DASA	Defense Atomic Support Agency
DNA	Defense Nuclear Agency
DoD	Department of Defense
DOE	Department of Energy
DOE/NV	Department of Energy/Nevada Operations Office
ERDA	Energy Research and Development Administration
FCDNA	Field Command, Defense Nuclear Agency
kt	kiloton
LOS	Line-of-sight
MED	Manhattan Engineer District
mrad	millirad
mrem	millirem
mR	milliroentgen
NTPR	Nuclear Test Personnel Review
NTS	Nevada Test Site
REEC	Reynolds Electrical & Engineering Company, Inc.
SNL	Sandia National Laboratories
UNTPR	Underground Nuclear Test Personnel Review
VA	Veterans Administration

## APPENDIX C

### GLOSSARY OF TERMS

Beta Particle	A negatively charged particle of very small mass emitted from the nucleus of a radionuclide, particularly from fission product radionuclides formed during a nuclear detonation. Except for origin, the beta particle is identical to a high-speed electron. This may also be a positively charged particle of equal mass called a positron.
Dose	A quantity (measured or accumulated) of ionizing radiation energy absorbed into the medium it passes through. In a person, dose is measured in rem or rad.
Dose Rate	The amount of ionizing radiation energy that an individual or material could absorb per unit of time. Dose rates are usually expressed as rad or rem per hour. Subdivisions of a rad or rem also are used, e.g., mrem/h means millirem per hour. (A millirem equals one thousandth of a rem.)
Exo-atmospheric	This refers to the area outside the gaseous mass which envelopes the earth.
Exposure	A measure expressed in roentgens (R), of the ionization produced by gamma or x rays in air. [This may also be represented by subdivisions of R; e.g., $1/1000\text{ R} = 1\text{ milliroentgen (mR)}$ .]
Gamma Radiation	Radiation of high energy originating in atomic nuclei and frequently accompanying the emission of alpha and beta particles in radioactive decay. Gamma rays can travel considerable distances through air, although the intensity decreases rapidly at increasing distances from the source.

Ionizing  
Radiation

This includes any particulate or electromagnetic radiation capable of producing ions, directly or indirectly, in its passage through air or matter. Alpha and beta particles produce ion pairs directly, while the electrons of initial ion pairs produced by gamma and x rays in turn produce secondary ionization in their paths. Neutrons may displace a positively charged part of a nucleus, such as a proton or alpha particle, which produces secondary ionization.

Leukemia  
Cluster

An apparent but unexpected or extraordinary group of leukemia cases within some number or group of persons.

Privacy Act

The Privacy Act of 1974 is a part of Public Law 93-579. This was an Act to amend Title 5, U.S. Code, by adding Section 552a, which was to safeguard individual privacy from the misuse of federal agency records, to provide that individuals be granted access to records concerning them which are maintained by federal agencies, to establish a Privacy Protection Study Commission, and for other reasons.

rad

An acronym for "radiation absorbed dose," a unit of absorbed dose of ionizing radiation. A dose of one rad means the absorption of 100 ergs of energy from ionizing radiation per gram of absorbing material (e.g., body tissue).

rem

An acronym for "roentgen equivalent man or mammal". A rad of radiation absorbed dose in tissue multiplied by the quality factor (QF) of a particular radiation equals the rem dose. Current QF values are one for x, gamma, and beta radiations; 10 for neutrons; and 20 for alpha particles.

## GLOSSARY OF TERMS (concluded)

roentgen	A special unit of exposure to ionizing radiation. It is defined precisely as that quantity of gamma (or x) rays that, when completely stopped in air, will produce positive and negative ions with a total charge of $2.58 \times 10^{-4}$ coulombs in one kilogram of dry air under standard conditions.
Thermoluminescent Dosimeter (TLD)	An instrument used to detect and measure accumulated radiation exposure; thermoluminescence refers to the release of the accumulated energy in the form of light upon heating of the absorbing medium.
VELA UNIFORM	A DoD program designed to improve the capability to detect, identify, and locate underground nuclear explosions.
x rays	Electromagnetic radiations produced by electron reactions, as opposed to emissions of gamma photons (rays) given off by nuclei. Otherwise, high energy x rays are identical with gamma photons of the same energy.
